Finance Tracker Dashboard: Core User Flows

Project: FTD (Finance Tracker Dashboard)
Target Audience: Retail investors, technology & stock enthusiasts, and platform administrators

---

Document Overview

This document outlines the core user flows for the FTD platform. The architecture shifts away from standard investment recommendations to focus entirely on parsing information, verifying evidence, and tracking narrative evolution. The following maps outline exactly how users interact with the front-end interface to achieve their core research objectives.

User Flow 1: Account Registration & Onboarding

1. Goal

An unauthenticated visitor wants to create a secure personal account on the platform to begin conducting research and managing workspaces.

2. Page Migrations

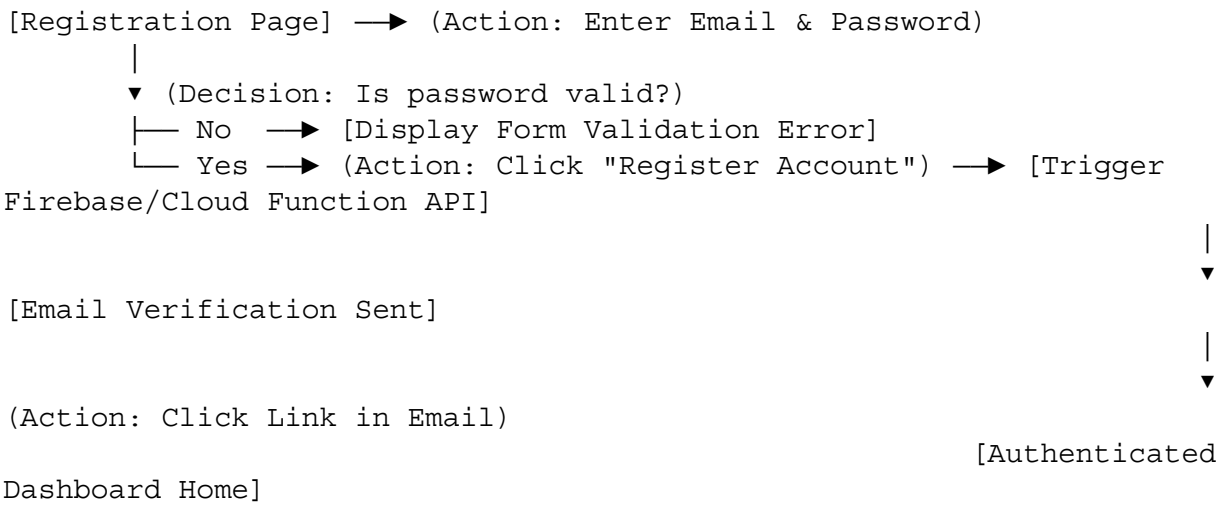

- Landing Page / Login Page → Registration Page → Email Verification Prompt → Dashboard Home

3. Entry Points, Steps, and Decisions

- **Entry Point:** User visits the main app URL and clicks "Sign Up" on the landing/login page.
- **Step 1:** User fills out the registration form with their email and a new password.
- **Decision 1:** System runs client-side validation. If fields are invalid, show an error. If valid, the user clicks "Submit".
- **Step 2:** The backend hashes the password using bcrypt and generates a secure verification email.
- **Step 3:** User receives the email, clicks the activation link, and is routed back to the authenticated platform.

4. Decision Points & Actions Map

```
[Landing/Login Page]
        |
        ▼ (Action: Click "Sign Up")
```

User Flow 2: Ticker Keyword Search & Dashboard Analysis

1. Goal

An authenticated user wants to quickly evaluate the credibility of market narratives around a specific stock ticker, cryptocurrency, or tech topic.

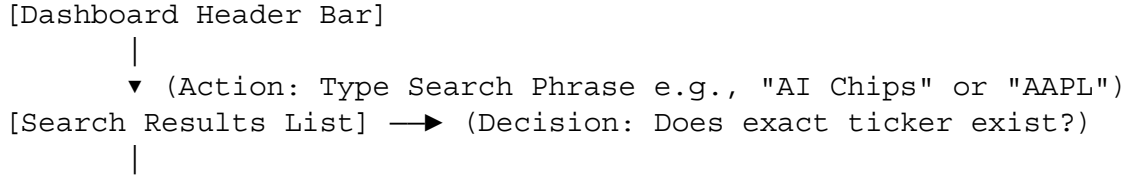

2. Page Migrations

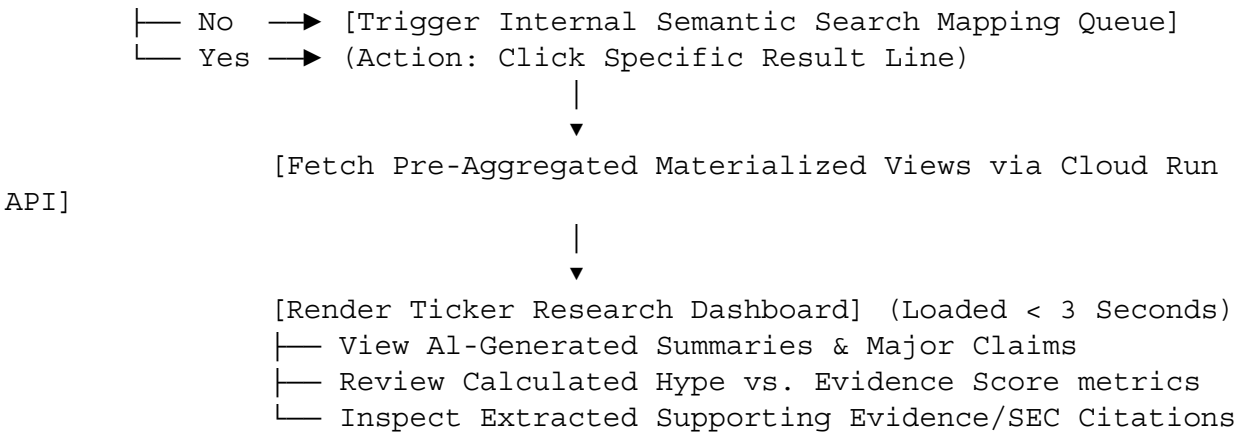

- Dashboard Home → Search Results Dropdown → Ticker Research Dashboard

3. Entry Points, Steps, and Decisions

- **Entry Point:** Search input bar located prominently at the top of the main authenticated header.
- **Step 1:** User types a keyword, ticker symbol (e.g., "$TSLA"), or company name.
- **Decision 1:** User looks at the instant-match dropdown results displaying candidate matching tickers along with brief current metrics.
- **Step 2:** User selects the desired asset from the list.
- **Step 3:** The app transitions pages to load the comprehensive overview under 3 seconds.

4. Decision Points & Actions Map

User Flow 3: Workspace Creation & Asset Tracking

1. Goal

An investor wants to assemble a dedicated watch group of related companies to keep track of concurrent tech developments without searching for them individually every day.

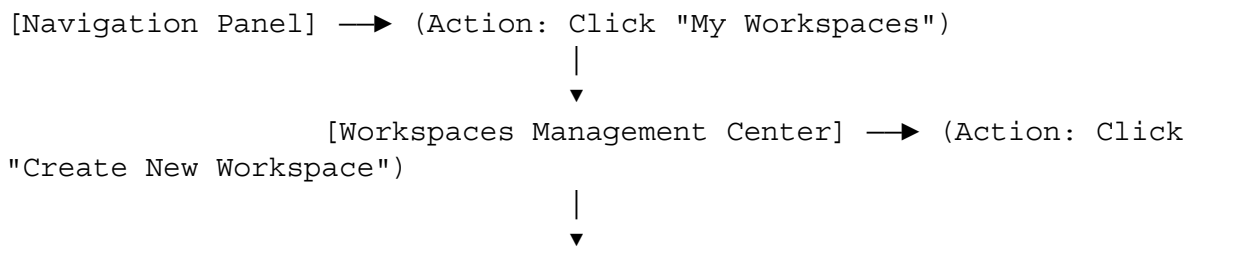

2. Page Migrations

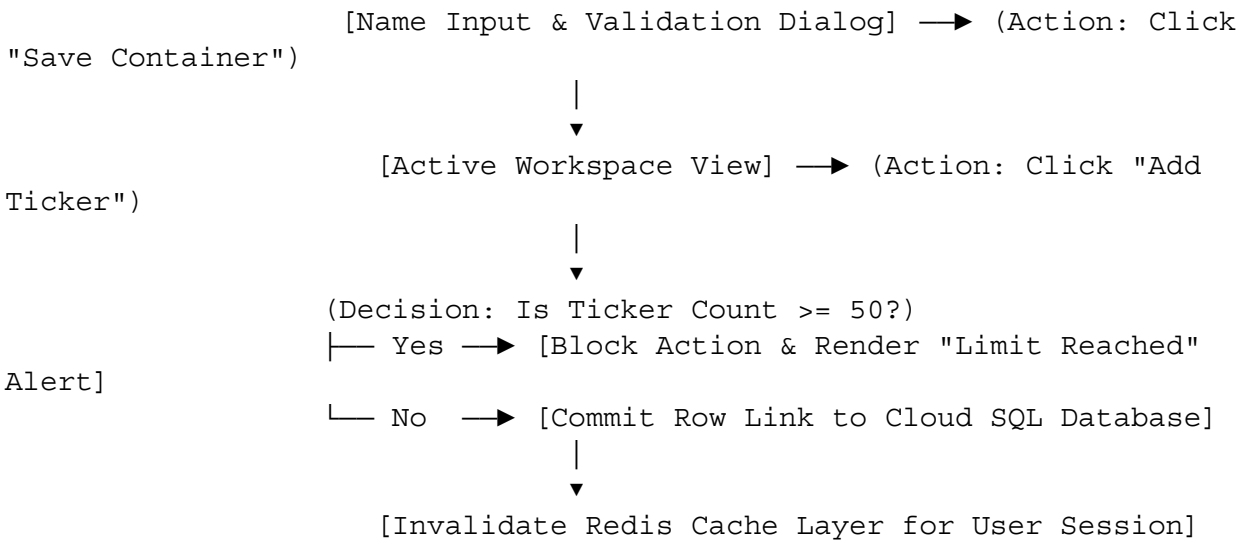

- Any Page (Header Navigation) → Workspaces Management Center → Individual Workspace Grid View

3. Entry Points, Steps, and Decisions

- **Entry Point:** Left-side navigation drawer or the profile menu header labeled "My Workspaces".
- **Step 1:** User enters a clean name for a new container and saves it.
- **Step 2:** User inputs a series of ticker tags to link inside this newly created hub.
- **Decision 1:** System evaluates if the user is over the business logic threshold limit.
- **Step 3:** User Views soft-delete or configuration settings for maintaining historical continuity.

4. Decision Points & Actions Map

User Flow 4: Navigating and Exporting the Historical Narrative Timeline

1. Goal

A research enthusiast wants to understand how a company's corporate narratives have transformed over time in response to market shocks and download an official report for offline record-keeping.

2. Page Migrations

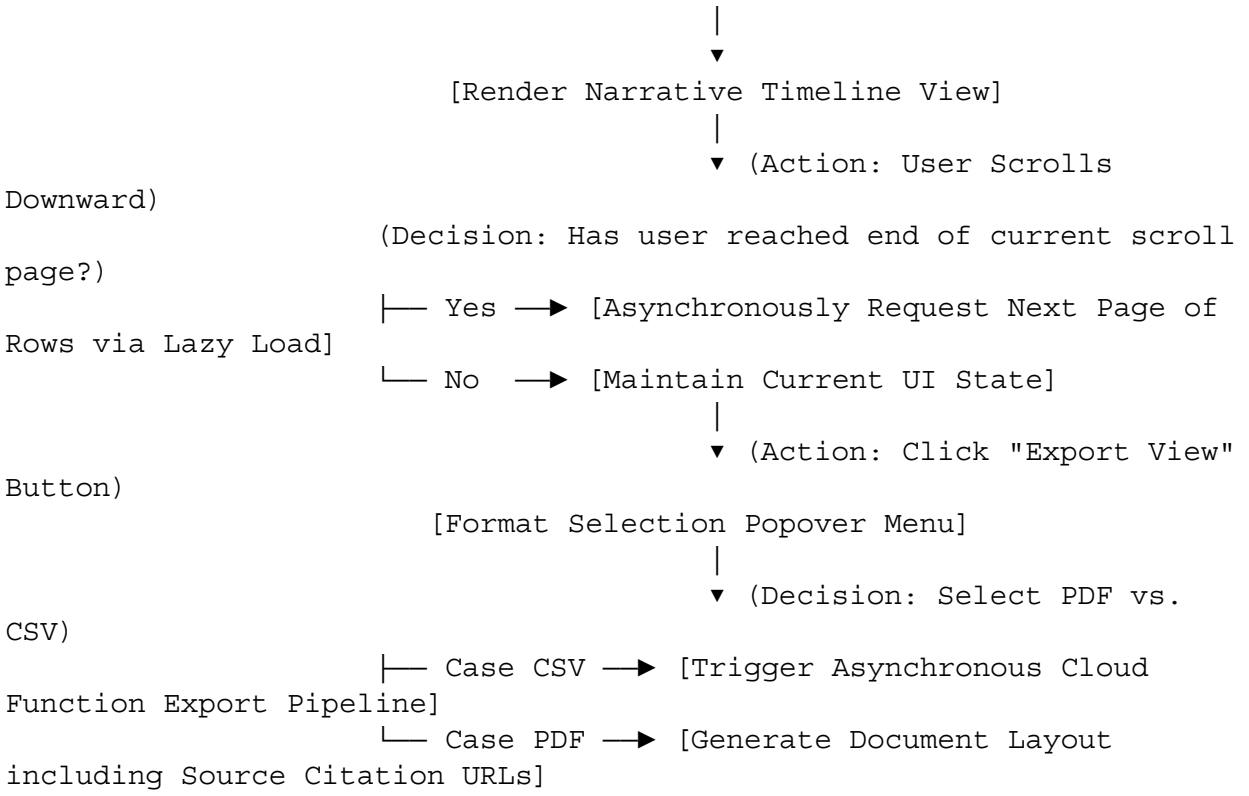

- Ticker Research Dashboard → Narrative Timeline Component → Browser Download Prompt

3. Entry Points, Steps, and Decisions

- **Entry Point:** Clicking the "Historical Narrative Timeline" tab inside an open asset page.
- **Step 1:** User scrolls down the chronological list of major events.
- **Decision 1:** System automatically triggers lazy-loading on scroll if older historical events are present.
- **Step 2:** User clicks on any specific event marker to inspect the underlying source document link.
- **Step 3:** User clicks the "Export Report" menu item.
- **Decision 2:** User chooses their preferred file formatting download standard.

4. Decision Points & Actions Map

User Flow 5: Advanced Multi-Hop Querying & Context Chat

1. Goal

A technical analyst wants to ask a natural language query comparing multiple competing technology assets to see structured comparative analysis directly from the AI agent.

2. Page Migrations

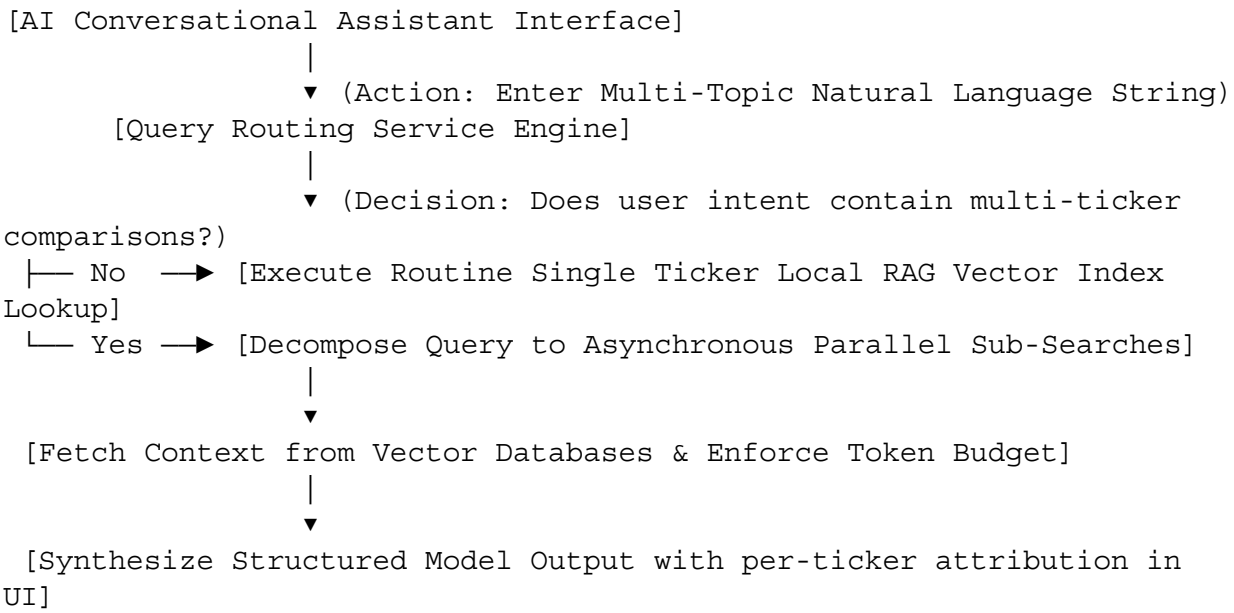

- Dashboard Home / Any Ticker Page → AI Conversational Assistant Panel

3. Entry Points, Steps, and Decisions

- **Entry Point:** Clicking the sticky chat bubble icon on the bottom right or using the "Conversational Chat Module" area on the interface.
- **Step 1:** User inputs a complex natural language prompt comparing multiple entities (e.g., "Compare the evidence behind the autonomous driving claims of Ticker A versus Ticker B").
- **Decision 1:** The internal Query Router identifies if the prompt contains single or multiple ticker entities.

- **Step 2:** The engine conducts parallel vector searches and structures a single unified context window.
- **Step 3:** The user receives a structured, source-attributed answer back within the chat box.

4. Decision Points & Actions Map

User Flow 6: Crowdsourced Error Reporting & Mapping Overrides

1. Goal

An authenticated user discovers a messy data association error on the UI (e.g., a news article about a company incorrectly associated with an unrelated stock ticker symbol) and wants to report it to maintain platform hygiene.

2. Page Migrations

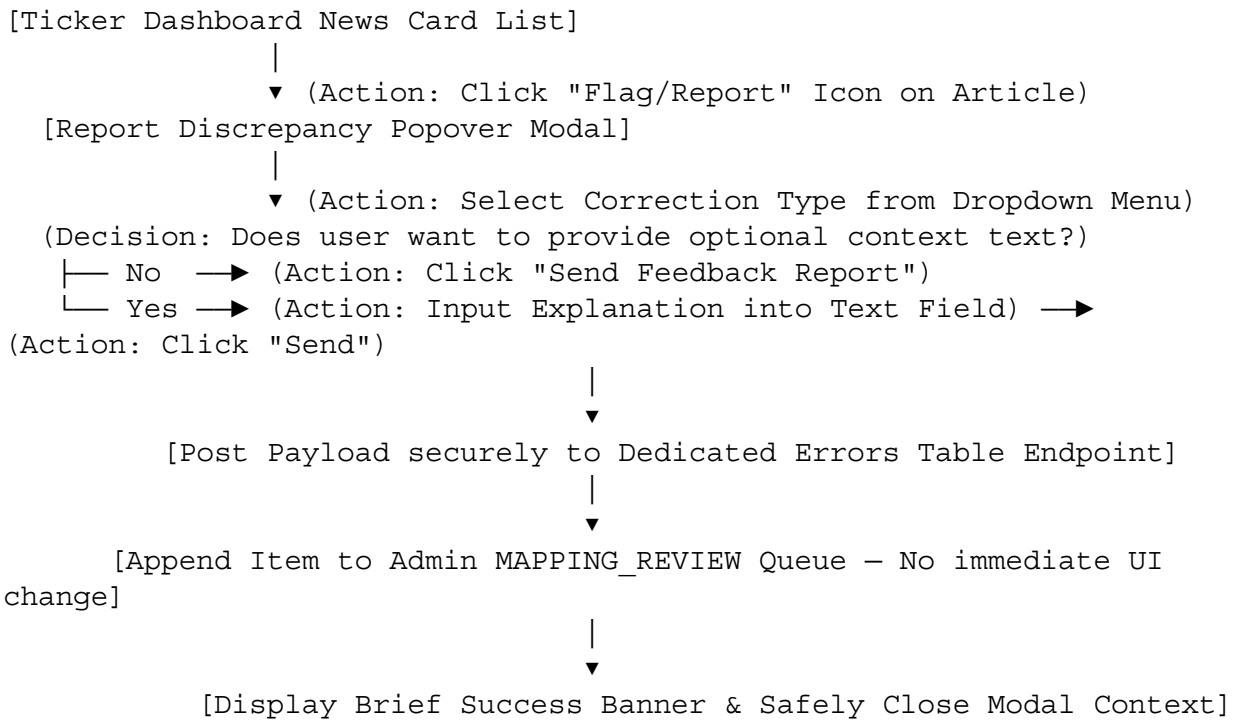

- Ticker Research Dashboard (News Feed Section) → Error Report Form Pop-up → Return to Dashboard

3. Entry Points, Steps, and Decisions

- **Entry Point:** Small flag or warning icon located immediately adjacent to individual news/social article cards.
- **Step 1:** User clicks the flag button on the incorrect source line.

- **Step 2:** User completes a brief modal menu checking the reason for the report (e.g., "Wrong Ticker Mapping").
- **Decision 1:** User chooses whether to include text notes or hit submit immediately.
- **Step 3:** Clicking submit creates a record in an admin review queue without modifying the live database view for other users immediately.

4. Decision Points & Actions Map

User Flow 7: Administrative Mapping Review and Validation

1. Goal

An administrative user wants to audit automated entity-to-ticker mapping rates and resolve user-flagged errors to keep data ingestion accurate.

2. Page Migrations

- Admin Dashboard Home → Mapping Review Queue → Action Acknowledgment Modal

3. Entry Points, Steps, and Decisions

- **Entry Point:** "Admin Operations Control Portal" URL accessed via an authorized staff

account.

- **Step 1:** Admin views system KPIs showing automated mapping accuracy trends.
- **Decision 1:** If the automated match success rate drops below 80%, an automated system warning banner stands out at the top.
- **Step 2:** Admin opens the MAPPING_REVIEW queue containing low-confidence automated logs and user-reported entries.
- **Decision 2:** Admin selects an item and chooses to Approve, Remap, or Dismiss the error.

4. Decision Points & Actions Map
